

Nonequispaced FFT

By Stefan Kunis

Shaker Verlag Jan 2007, 2007. Taschenbuch. Book Condition: Neu. 211x149x12 mm. Neuware - The principal contribution of this thesis is the further development of computational tools in Fourier analysis that generalise the FFT: 1. We start with a unified introduction to discrete Fourier transforms on the d -dimensional torus, the hyperbolic cross, and the sphere as evaluations of corresponding polynomials at a set of sampling nodes. Furthermore, we follow the 'smoothness-and-decay' principle and construct for their subsequent usage sharply localised trigonometric and spherical polynomials from 'smooth' Fourier coefficients. 2. Subsequently, fast Fourier transforms are considered. In contrast to [BD89, DH94, PST98b], our FFTs on the sphere and on the hyperbolic cross allow for arbitrary sampling schemes. Moreover, we focus on the substantially different computational costs that arise in various implementations of the nonequispaced fast Fourier transform and improve [DR93, Bey95, AD96, Ste98, PST01] to trade precomputation storage as well as target accuracy for computation time in a manageable way. 3. We contribute new versions of the fast Gauss transform. Compared to multipole approximations in previously suggested schemes [Str91, GS91, GS98, BR02], our method relies solely on nonequispaced FFTs. Uniform error estimates are proven and allow for the adjustment of involved parameters. We easily...
